INTE 12213– Object Oriented Programming

Lab Exercises 05

You have to submit the work that you have completed (not mandatory to complete fully, but marks will be given based on the completion) by today (11th January) 6.30pm

---

You are required to develop a small software to handle the inventory of the New Building at Department of Industrial.

- Inventory contains furniture, electronic equipment etc.
- For this task you do not need to store or retrieve data from a database. (i.e. You can use variables/ arrays or any other data structure to store data).
- You have to apply the OOP concepts when developing the software.
- There should be mechanisms to enter new items to inventory, modify existing item details, remove items from the inventory & view the items available in the inventory.
- You can add your own creativity for the interfaces (windows).
- You can refer materials (i.e. Online/ Printed materials etc.) but your work should be unique.
